The screenshot displays a Windows desktop with two main applications open: a command prompt and a Python script editor.

Command Prompt (Left): The terminal shows the execution of a Python script named `36.py`. The script is located at `C:\Users\manik\OneDrive\Desktop\computer vision\36.py`. The output indicates that the script was executed successfully, and the results are displayed in the `Watch Recognition` window.

Python Script (Right): The script `36.py` is a Python program that demonstrates template matching using OpenCV. It defines a template image `gray_template` and a target image `img`. The script uses `cv2.cvtColor` to convert the images to grayscale, `cv2.matchTemplate` to perform template matching, and `cv2.minMaxLoc` to find the maximum value and its location. The results are printed to the console, showing a matching value of approximately 0.6. The script also uses `cv2.rectangle` to draw a bounding box around the detected object and `cv2.putText` to display the text "Watch Detected" on the image. Finally, the script uses `cv2.imshow` to display the image and `cv2.waitKey` to wait for a key press before closing the window.

Watch Recognition Window (Bottom Left): This window displays the output of the template matching process. It shows a grayscale image of a butterfly on a flower, with a red bounding box highlighting the detected object. The text "Watch Detected" is overlaid on the image.

Taskbar (Bottom): The Windows taskbar is visible at the bottom of the screen, showing the Start button, search bar, and several pinned applications including File Explorer, Microsoft Edge, and Google Chrome. The system clock indicates the time is 14:35 on 12-08-2020.

[illegible]

The image shows a Windows desktop with two windows open. The left window is a terminal titled "CMD Shell 3.14.3" showing the execution of a Python script. The script is located at C:/Users/manik/OneDrive/Desktop/computer vision/31.py and is being run from a command prompt. The output shows the script being restarted multiple times, with the last restart showing an error: "Cascade file not found!".

The right window is a Python script editor titled "38.py - C:/Users/manik/OneDrive/Desktop/computer vision/38.py (3.14.3)". The script is a face detection program using OpenCV. It imports cv2, reads an image from C:/Users/manik/OneDrive/Desktop/computer vision/image.jpg, and uses a CascadeClassifier to detect faces. The script prints the number of faces detected and shows the image with a bounding box around the face.

The bottom of the screen shows the Windows taskbar with the Start button, search bar, and several application icons. The system tray shows the date and time as 14:38 on 12-08-2026.

The image shows a Windows desktop environment with two terminal windows open. The left terminal window, titled "IDLE Shell 3.14.3", displays a series of restart commands for various Python scripts located in the directory "C:/Users/manik/OneDrive/Desktop/computer vision/". The scripts are named 31.py, 32.py, 33.py, 34.py, 35.py, 36.py, 37.py, 38.py, and 39.py. A small window titled "Veh..." is overlaid on the terminal, showing a video feed of a man's face. The right terminal window, titled "IDLE - C:/Users/manik/OneDrive/Desktop/computer vision/39.py (3.14.3)", shows the source code for the 39.py script. The code imports the cv2 module and defines a video path. It then captures frames from the video and uses cv2.createBackgroundSubtractorMOG2() for background subtraction. The code finds contours, calculates their area, and draws a bounding box around the detected object (a vehicle) in the video frame. The status bar at the bottom shows the system clock as 14:42 on 12-08-2020.
